RENTNEST - QA SUMMARY

1. TOP 5 ISSUES TO FIX FIRST

1. Tenant can open another tenant's application by pasting its URL (Sofia viewed Arjun's).
   Why: privacy and security breach. Personal and income data is exposed.
2. Landlord can accept 2 applications for the same property.
   Why: a property can only be leased to one tenant. This causes double leases and payment disputes.
3. Identity check passes with the wrong document (Driving License selected, PAN card uploaded, still approved).
   Why: the screening result cannot be trusted, and the screening report is the product's main value.
4. Landlord credits go below zero with no error and no prompt to buy credits.
   Why: lost revenue, and reports are given away free.
5. Income step: status stays "Pending" until the page is refreshed, and the entered bank details are lost if the page is reloaded while pending.
   Why: the tenant is blocked from continuing and has to start the step again, so applications are abandoned.

Lower priority (fix later): no required-field asterisks, pay-rent summary layout broken (desktop and mobile),
postal code without a space rejected, no minimum-age (18+) check on date of birth.

2. RELEASE DECISION: NO

First Three issues which are reported are High security or data-integrity problems.
Credits going negative(below zero) is a revenue problem.
The income step blocks the core journey. Release only after items 1-5 are fixed and retested.

3. WHAT I WOULD AUTOMATE NEXT

- API access-control tests (tenant A cannot read tenant B's application; role checks on every endpoint).
- Accept-application rule: a 2nd accept on the same property must be rejected.
- Credit balance boundary tests (0 credits, last credit, no negative balance).
- Input validation tests (date of birth, postal code, rent amount, split count 1-4).
- Run everything in CI against a freshly reset database.

4. WHAT I COULD NOT TEST, AND WHAT I WOULD NEED

- Backend code and database internals: black-box rules, server.js out of scope. Needs read access to the code or a test DB.
- Real VerifyNow and BankBridge providers: only sandbox scenarios were used. Needs real provider sandboxes or contracts.
- Real card payments and refunds: only the test card was used. Needs a payment sandbox with failure cases.
- Email and notifications: not observable in this app. Needs a mail inbox or log.
- Cross-browser, real devices and accessibility: only Chrome and a resized window were used. Needs a device or cloud browser farm.
